Amkette, digital storage and lifestyle peripherals manufacturer, has launched cleaning solutions that utilize nanotechnology. The company claims that these products are self-cleaning products that, when applied to typical LCDs, makes the dirt disappear.

The nanofibers significantly increase the fabric's surface area and porosity, giving it superior wiping characteristics and the ability to absorb oil and ultra-fine dust particles less than one micron in diameter.

These cleaning kits are available in two shapes: one for small screens like laptops, computer monitors, and other devices, and another for larger screens like LCDs and Plasmas. The design of these kits makes them perfect for use while traveling. While the kit for the larger screens is boat-shaped in design and uses an anti-static brush with soft bristles.

The compact cleaner is intuitively designed with the cleaning solution bottle neatly fitting into the body of the cleaner. With the press of just one button, the bottle is out for spraying and then as easily as it appears it goes back into the body.

The company, in order to ensure that the solution being used is easily refillable while at the same time safe for LCD screens. On this, Rajiv Bapna added, "We also share the formula to make the cleaning solution at home for hassle-free refilling of the cleaning solution bottle."
